**FLOWER
SEED**

CATALOGUE
2025-2026

Dear Customers,

For 166 years, we have dedicated ourselves to bringing joy, peace, and beauty to your cities, gardens, and homes.

The flower is a powerful symbol — a vivid image of life itself, sprouting, growing, maturing, blooming, and ultimately fading to nothing. Perhaps this is why it fascinates us, having accompanied us since time immemorial, a constant presence through life's highs and lows. We take pride in accompanying you on this journey, growing together, and shaping the future hand in hand.

The first of the new varieties we present here is also a symbol of dynamic development and progress in breeding — the unique *Salvia splendens* **Hotbloom** group. This challenges the established clichés among growers, as it offers **high genetic compactness and excellent tolerance to heat**. The combination of characteristics offered by this group makes it unique among the ranges which are currently available. To begin with, we are introducing varieties in red, purple, vibrant orange, pink and lilac. Of course, all of the seeds we supply are of the finest quality and reasonably priced.

Fans of **Dot Star F1** petunias with white dots and spots will be delighted by the introduction of a new, fifth colour: **Dot Star F1 Lilac**, this time with the base colour in shades of lilac. Since its introduction, the group has become an integral part of our petunia ranges and its popularity has grown over the years.

The rising global popularity of *Colocha coleus* inspires our breeders to pursue this programme with even greater dedication. Testament to this is the *Coleus* **Colocha Red**, which enhances the existing group with a highly attractive and sought-after colour.

We recently completed the transition to and practical implementation of a **new pelleting technology** for petunia seeds. This next generation of pellets are firm, do not crack, pelleting material does not flake off and they dissolve easily when they come into contact with water. Another indisputable benefit of this technology is even faster and more even germination of pellets once sown.

Thank you for your patronage, patience and unwavering trust in us and our products. We look forward to working with you in the new sales season.

Yours sincerely
Jan Černý / Jakub Černý

PETUNIA HYBRIDA NANA

We offer an original assortment of hybrid petunias, which belong to the group of multiflora and grandiflora petunias. These varieties have been specially bred for the specific climatic conditions in Central Europe. They perform excellently in sunny and warm summers and do not disappoint in cold and rainy weather.

PETUNIA HYBRIDA GRANDIFLORA NANA

Resistant to harsher climatic conditions, plant height 40–45 cm, well-branched, free-flowering until the end of the vegetation season, flower size 7–10 cm, excellent in flower boxes and containers. Ideal for places protected from wind and rain.

"MISTRAL F1" SERIES

"Mistral F1" is a group of modern well-performing varieties with large blooms. The plants are characterised by low growth 30–35 cm, high compactness of the plant and resistance to adverse weather. They are early-flowering throughout the season with large blooms with a diameter of 8–10 cm; suitable for potting as well as for bed planting. The "Mistral F1" series is comparable with the very best groups in the ranges on offer.

"DOT STAR F1" SERIES

A unique series of petunias with white dots and spots

A combination of vibrant and rich colours with white dots and spots on the petals gives the flowers an unprecedented and highly attractive appearance. The shape, frequency and intensity of the little white patterns on the petals can change during hot or changeable weather. This makes every flower a unique original.

Just like other multiflora petunias from Černý Seed Company, the "Dot Star F1" series is highly resistant to adverse weather.

Plants grow to a height of 30–35 cm, branch well and bloom abundantly, with flowers that have a diameter of 6–7 cm. They are suitable for beds, planters and pots. They quickly regenerate after heavy rain and regain their impressive appearance. Available only as pellets.

The "Dot Star F1" group has been bred over many years by plant selection and its genetics do not come from commonly available varieties from cuttings.

"PETIT F1" SERIES

A very early-flowering series. Several flowers always come into bloom at the same time. They create a very densely branched compact little bush. Flower size is 4–5 cm. They are intended in particular for planting in containers but also grow well in beds. They grow to a height of 20 cm. Hybrids are resistant and flower abundantly throughout the whole season. Cultivation is practically the same as with other petunias.

Vivid and intense colour shade.

E598

Petit F1 Red Vein

Red flowers with a distinct pattern created by the veins, the latest variety, extends the popular group of dwarf petunias to include a new highly attractive colour combination.

"EYELASH F1" SERIES

A unique, premium series of multiflora petunias. They are characterised by a **circular venation** which extends halfway into the flower, creating an impressive eye-catching colour transition.

The varieties in this group have a compact and uniform growth habit, which makes it easy to combine various colours, and the **flowers are 6.5–7 cm in diameter**. They grow to a height of **25–30 cm**. They are perfect for containers, hanging baskets and for use as bedding plants. Seeds are supplied only in pelleted form.

"AVALANCHE F1" SERIES

This is a unique group of overhanging hybrid petunias. When cultivated correctly, eight colour shades create a true "avalanche" of large flowers in bright and pastel colours. Flowers can reach 7–9 cm in diameter. Young plants are erect at first. Only after having grown, does their own weight make them fall and spread further in cascades. It is important to replant them correctly and to keep the plants growing continuously.

Very impressive in balcony flower boxes, large hanging baskets and bowls etc. The ideal location is in a sunny area. They need regular watering and fertilisation during the whole vegetation period.

Diamond F1 Purple

Intense dark purple-dark violet, flower size 7.5–8.5 cm. Spreading cascade 100 cm. Luxuriant growth.

"DIAMOND F1"

Globally unique variety — a truly cascading petunia grandiflora grown from seed

The original overhanging variety from the Černý Seed Company, which can boast the largest spreading cascade among seed-grown grandiflora varieties. These well-branched plants grow luxuriantly and create an impressive 80–100 cm cascade. The variety is rich in flowers, the size of which is 7.5–10 cm. It is intended for planting in raised flower containers, window boxes and big hanging baskets, which can show its overhanging character to good advantage. It can also be used for bed planting. The plants have a creeping growth habit. They grow together in a short period of time, creating a colourful carpet about 20–25 cm high. Like all luxuriantly growing petunias, it is more demanding on nutrients.

E315

E495

E315 Velvet F1 Purple

A time-proven and still very popular variety. Intense violet-purple flowers with a dark throat, size 5.5–6 cm, plants create a cascade reaching 100 cm.

E495 Velvet F1 Salmon Shades

An attractive variety with interesting flowers in fine pastel shades of salmon, flower size is 7–8 cm. The spreading cascade can reach about 80 cm.

"VELVET F1" SERIES

The "Velvet F1" series of varieties is intended especially for planting in containers such as flower boxes, hanging baskets or raised containers to emphasise their overhanging character. They create a massive cascade and bloom throughout the entire season. If cultivated correctly, they bloom on the whole surface of the plant. Thanks to the length of their overhanging shoots reaching 80–100 cm, the varieties of the "Velvet F1" group can compete with varieties grown from cuttings.

All the "Velvet F1" varieties can also be planted in flower beds where they grow together over a short period of time and create a flower carpet about 25 cm high. Excellent health, exuberant growth, flowers of medium size and high seed germination are the great advantages of these varieties. Prices of seeds delivered are also attractive. The method of cultivation does not differ from other petunia groups. Plants have a creeping character from the very beginning. Proper nutrition has a positive influence on the length of the spreading cascade.

PETUNIA HYBRIDA GRANDIFLORA SUPERBISSIMA NANA

This group of varieties represents a speciality in our product range. They are especially prized for their giant flowers showcasing rare and unusual colours, which are about 16 cm in diameter and have ruffled and frayed edges. In contrast to usual diploid varieties these ones are tetraploid, which has an effect on their appearance and character.

The plants are robust, high, weakly branched. Especially suitable for flower boxes and containers but they can be used successfully as bedding plants as well.

Free-flowering, white ruffled flowers with dark veins in the throat. Flowers become light purple under higher temperatures, plants are robust, vital, and resistant to climatic conditions.

E1355

Copper Spotted

The variety is distinguished by its giant flowers with a combination of yellow-copper colours coming from the throat with white and pink spots, which are irregularly scattered on the flowers.

THE "GOLDEN HERITAGE" SERIES OF HISTORICAL VARIETIES

We are proud to reintroduce four historical petunia varieties from the Černý family's extensive gene bank, which has been preserved for many decades.

These are original non-hybrid varieties cultivated before World War II and later, in the period before the first F1 hybrids were developed. Their characteristics, which some would consider rare from today's point of view, will undoubtedly attract the attention of all flower growers. They will enrich the current product ranges with interesting types of plants which go above and beyond the standards set today.

PETUNIA HYBRIDA MULTIFLORA NANA

E1351

Rosa Bonheur

A dark pink multiflora which produces 50% double flowers reminiscent of carnations and 50% single flowers with an eye-catching yellow throat. The flowers have a diameter of 5.5–6.0 cm. Plants are well-branched and 35–40 cm tall. They are suitable for planting both in containers and in beds.

PETUNIA HYBRIDA GRANDIFLORA FIMBRIATA NANA

E1352

White Double

A snow-white grandiflora, producing intensely fringed flowers which are 50% double and 50% single. These flowers catch the eye at first glance with their yellow throat which, together with the white colour, gives the flowers an attractive contrast. The flowers have a diameter of 6.5–7.0 cm, the plants are well-branched and 35–40 cm tall. They are suitable for planting both in containers and in beds.

PETUNIA HYBRIDA GRANDIFLORA NANA

E1353

Peace

The first post-war variety, introduced in 1947 and subsequently modified to its present form. The name of the variety evokes a celebration of peace. A light pink grandiflora with a silvery edge and less prominent veining, with flowers which are 50% double and 50% single. The flowers have a diameter of 6.5–7.0 cm, the plants are well-branched and 30–35 cm tall. They are suitable for planting both in containers and in beds.

PETUNIA HYBRIDA GRANDIFLORA NANA

E1354

Purple Dwarf

František Černý (the great-grandfather of the current owners) started breeding in 1948 and only after eleven long years, in 1959, did he introduce onto the market the then unprecedented purple-red petunia, which produces 50% double and 50% single flowers. We are now once again offering this variety for sale in a modified form. The flowers have a diameter of 5.5–7.0 cm, the plants are moderately densely branched with a height of 40–45 cm. This variety is ideally suited for planting both in containers and in beds.

From František Černý's book "Gardeners":

The last plant in the group of low double-flowered petunias was the Peace variety. The breeding of this variety lasted from 1938 until 1947, when it was introduced onto the market. We were particularly fond of it throughout the breeding process. It was a child of war, and that is why it was given the name Peace, which was so often on our minds as we worked. It was obtained by selecting a lighter and less frayed deviation of the Pink Dwarf variety. The result of constant selection is flowers that are silvery pink at the edges.

A group of classic, popular and widely grown varieties. Plant height can reach 30–35 cm. They are robust with strong stalks. These free-flowering varieties have large camellia-form flowers, almost 100% of which are double.

The ideal location is in partial shade. They can also be grown in sunny areas when watered sufficiently. They are characterised by their resistance and full flowering until the first frosts. These varieties are also suitable for bulb production.

"CHANSON F1" SERIES

"Chanson F1" is a group of popular hybrid spreading begonias with double and semi-double flowers. It offers the complete range of colours that begonias can offer. Plants grown from seed start flowering early and continue until the first frosts. Plants usually create 5–8 main shoots, where regular camellia-form flowers on long peduncles appear behind every leaf. Flower size is 6–8 cm. Plants create a cascade of 30–45 cm. Can also be used for bulb production.

Ideal for flower boxes, hanging baskets and higher spots to show its spreading cascading character. The two bicolour varieties we offer are unique.

"COPACABANA F1" SERIES

Varieties grown from seed

A good alternative to varieties propagated by cutting. Compact habit during production. Six colours available, bell-shaped flowers, flower size 6–7 cm, plant height in flower beds 35 cm. Tolerant to a wide range of cultivation conditions: drought, rain, full sun and shade.

When we compare this product to other types of begonia, it performs excellently in places exposed to full sunlight. It significantly extends the possibility of using these varieties in plantings.

Ideal for big hanging baskets, containers and garden beds.

Young plants have erect growth first and later produce a large quantity of side shoots. They create a small overhang in boxes. The growth in garden beds is decumbent.

Excellent seed quality. Available only as pellets.

"FLOWERBALL F1" SERIES

This new group of semi-double and double Begonias semperflorens "FlowerBall F1" is the ideal alternative to uneconomical varieties cultivated from cuttings. Apart from that, these Begonias are significantly more resilient in plantings than the competing varieties from seeds which are available. This means that the "FlowerBall F1" is in fact precisely what you are looking for! To start with, we are listing the four most important colours in this type: Pink, Red, White and Rose. However, you can look forward to extension of the range to include other attractive colours in the near future.

Plants grow to a height of 20–25 cm, are well-branched, compact in growth with flowers up to 4 cm in diameter. They have a self-cleaning ability, which makes caring for plantings much easier. The cultivation period is 12–15 weeks depending on the conditions.

Varieties are suitable both for mixed containers of different sizes and also for planting in beds with the possibility of combining individual colours. They are well resistant to higher temperatures and rain and bloom from spring until the first frosts.

“SENSATION F1” SERIES

This group of interspecific hybrid varieties complements the current range of begonias. These are highly resistant hybrid varieties which tolerate even the most extreme climatic conditions very well. These plants do not mind direct sunlight, heavy rain or shade.

They are characterised by robust growth and medium-sized single flowers. Plants reach a height of 60–70 cm, branch abundantly and have a flower diameter of 4–4.5 cm. They flower profusely from early spring until the first frosts. Cultivation time from sowing to flowering plants is 12 to 14 weeks. Suitable for planting in beds and large flowerpots, even, for example, in urban greenery. Planting is undemanding on maintenance.

"COLOCHA" SERIES

Unlike conventional Coleus plants, this group is characterised by its unique wavy and ruffled leaf edges which are soft to the touch. Plants are well-branched, moderately compact and grow to a height of 45–50 cm. The leaves become tinged with attractive, highly intense eye-catching colours. Varieties from the "Colocha" group thrive in direct sunlight as well as in shady locations. Plants tolerate high and low temperatures very well and retain their decorative qualities until the first frosts. Another prized characteristic is their late flowering. They are great for large containers, as well as for use as bedding plants or even grown as houseplants. The unusual exotic look offers new possibilities to attract customers with something really NEW and ORIGINAL.

These Coleus "Colocha" varieties represent the beginning of a comprehensive premium group.

WHY CHOOSE COLEUS COLOCHA?

- unique and exotic eye-catching look
- wide range of use
- very hardy
- late flowering
- seed supplied raw or as pellets

VINCA "VOLCANO F1" SERIES

The "Volcano F1" series represents the nine bestselling colours and the unique variety Peach. The varieties are intended for professional use and after trying them out, we are certain you will agree that they really do represent the very pinnacle of contemporary breeding. We also recommend that you pay attention to their price, which is absolutely unrivalled.

Plants are well-branched, have a compact habitus and grow to a height of 25–30 cm. The crop time from sowing to blooming plants for sale is 8–10 weeks. The flowers have overlapping petals, an intense colour and diameter of 5.5–6 cm.

"Volcano F1" plants are very resistant to diseases and stress factors. They tolerate heat, dry conditions and humidity well. They maintain their usual flower size and high colour intensity even under extreme conditions. They are perfect for use in various types of containers and also for planting in large beds.

"HOTBLOOM" SERIES

We are proud to present a brand-new species now available in the Černý Seed product range.

Hotbloom varieties represent a combination of the very best qualities you can expect from salvias. Plants are more **genetically compact** than most of the varieties available on the market, while at the same time exhibiting **excellent resistance to heat**. It was in the past usually very difficult for breeders to combine these two characteristics, meaning that growers were subsequently forced to compromise when choosing varieties. *Salvia* Hotbloom, however, is set to change this long-standing paradigm forever.

But the list of advantages doesn't end there! Plants branch profusely and form dense, compact bushes which immediately catch the eye with their large and striking inflorescences towering proudly above the foliage. The colour range includes the classic **Red** as well as **Purple**, vibrant **Orange**, **Rose** and **Lilac Halo**! Another undeniable advantage is its early flowering, saving precious greenhouse space and giving you the freedom to prepare your planting schedule with greater flexibility.

WHY GROW PLANTS FROM THE HOTBLOOM SERIES:

- high genetic compactness
- high resistance to heat
- early flowering
- wide range of colours including the unique vibrant Orange
- versatile use

"MEDIUS F1" SERIES — 7 COLOURS & MIX

Plants are extremely compact and well-branched as found in the multiflora type. However, they have large flowers characteristic of grandiflora. The presented varieties are therefore an exceptional blend of these two types, creating a unique combination of the best characteristics we can expect in Mimulus. The short time from sowing to actual sale of plants offers growers an excellent opportunity to acquire an attractive marketable product quickly, efficiently and cheaply. These are ideal plants for planting in shady and humid conditions. They are resistant to mild frosts and are therefore a good choice for cultivation in the spring and the autumn. Unlike most annuals, they even tolerate partial shade well. Suitable for use in pots and hanging baskets, either alone or together with other flowers. However, they stand out best when planted alone in places where their unusual flowers can truly come to the fore.

"DAY F1" GREEN-LEAVED SERIES

Plants in this range are characterised by a combination of the colour green and shades of brown on the edges of the leaves. Bright-coloured blossoms create massive inflorescences and flourish abundantly throughout the season until frosts arrive. Varieties are early, compact and have distinctive leaves. Their high resistance to pests and adverse weather is also characteristic.

At the peak of the growing season, these varieties reach a height of 25 cm (height without inflorescence) and including inflorescence, they reach a height of 35 cm. Plants reach 35 cm in width. During the season, each plant generates around 50 to 60 inflorescences, each with a diameter of 10–12 cm. These varieties are ideal for professional cultivation.

“NIGHT F1” DARK-LEAVED SERIES

These unique varieties from the “Night F1” series are characterised by their highly decorative brown leaves with a green border. The dark leaves are very effective in white pots. They can be used in countless horticultural compositions or in combination with green-leaved varieties.

The method of growing and superb properties are the same as those you are used to with the green-leaved varieties which you know so well. These plants are extremely resilient and love direct sunlight. The final height in a bed can reach 35 cm and flowers grow to 10–12 cm in diameter. Seeds are supplied already scarified with excellent germinating capacity.

"FALCON F1" CMS* SERIES

SELF-CLEANING, POLLEN-FREE AND ENDLESSLY BLOOMING? These are precisely the features offered by the new series of premium geraniums being introduced by Černý Seed s.r.o.

What is the main advantage of the new "Falcon F1" group? Unlike conventional geraniums, **this new generation of varieties does not produce any pollen**. As a result, it does not attract insects and does not produce the unwanted spikes which it is recommended are removed during the season in conventional varieties in order to avoid reduction of new flowers. In the "Falcon F1" group, the inflorescence falls off spontaneously after flowering and the plants continue to flower. Apart from this, the lifespan of the inflorescence is more than 7 days longer and plants produce up to 20% more flowers during vegetation than conventional varieties.

Cultivation is identical to that of conventional geraniums. Plants are well-branched and compact, 25 cm in height without inflorescence (35 cm with inflorescence). The inflorescences are firm, 10–11 cm in diameter and flower size is about 4 cm. They tolerate both direct sun and partial shade extremely well. Suitable for containers, hanging baskets and beds. In large plantings, you gain a vibrant colour palette which does not stop flowering thanks to the self-cleaning effect. Seeds are available in scarified form.

Note: To better preserve the advantages of pollen-free varieties, we recommend isolation from conventional pollen varieties. Spatial isolation should be at least 50 m.

* Cytoplasmic male sterility

MAIN ADVANTAGES OF THE NEW "FALCON F1" POLLEN-FREE GENERATION:

- self-cleaning effect — there is no need to remove spikes
- they do not stop flowering — they do not produce any seeds
- this means that inflorescences have a lifespan lasting more than 7 days longer
- plants produce up to 20% more flowers during vegetation
- people who suffer from allergies will also appreciate the absence of pollen

HISTORY OF THE “ČERNÝ SEED COMPANY”

 Inm. Eiferlich bezeugt furmit dem Hause
 Franz Cerny aus Jaromerice in Bohmen, dafs
 er selbst vom 1. October 1888 bis 25. Februar 1893, in
 den Gartenereien St. Hochgeborenen Herrn Baron Nathaniel
 von Rothschild in Wien, Reichenau, Ennsfeld N.O.
 und Schillersdorf Traus. Schlesien, als Gartengehilfe
 in Condition gestanden ist, und sein freiwillig aus
 dieser Stellung Austritt. Herr Cerny hat sich ausserdem
 dieses Zeugnisses, sehr ausserordentlich moralisch
 betragen und die vorfindenden Arbeiten jederzeit
 mit Eifer und Lust mit grossen Fleifs durchgefuhrt.
 Als...

František and Marie Černý –
classifying begonias

Lily of the valley rhizomes
for forcing

The story of the company is a story of generations of gardeners in the Černý family and their love of flowers, persistence and a bit of luck along the way. The company was founded by Ferdinand Hlaváček (1822–1897) as a regular horticultural business in 1859.

In 1896, he married off his daughter to František Černý (1865–1925), who had been trained as a castle gardener and who had even worked in the famous gardens of Baron Rothschild in Vienna. He was a true master of the art of flower arrangement.

In 1928, František Černý (1896–1968) and Marie Černá (1903–1987), the next generation of gardeners, started to specialise in breeding and production of seeds, especially of petunias and begonias. Their first success came in 1934 when the original petunia variety Karkulka was introduced. They bred a number of conventional non-hybrid varieties together and managed to gain recognition among the competition of established German seed suppliers.

The company has always been a typical family-run business where generations of gardeners – breeders have handed down their knowledge and biological material.

The company was nationalised in 1960. It became part of the state-run enterprise Semptra, which established a breeding station specialising in petunias and begonias. The work started in the 1930s continued. The names

Ing. Jan Černý (1928–1980) and Alenka Černá (1928–2000) are associated with the creation of the first hybrid varieties of begonia (1959) and petunia (1960). They gradually managed to breed a wide range of hybrid varieties which were competitive on an international level.

In 1991, the business was returned to the Černý family within the framework of restitution and continued to build successfully on its past tradition. A representative of the next generation, RNDr. Jan Černý, also devoted his life to breeding of flowers, breeding a range of modern hybrid varieties of begonia and petunia. His two sons, PhDr. Jan Černý and Bc. Jakub Černý, currently work in and manage the business. The team of experienced employees, some of whom have been working in the company for more than 25 years, is your guarantee of the high quality of seeds produced.

The company is still a specialised seed business producing seeds of its own varieties of petunia, begonia, cyclamen and pelargonium. It focuses intensively on breeding and new varieties are launched onto the market practically every year. Seeds are supplied to wholesale customers, gardeners and flower enthusiasts. Most of the seeds produced are however exported.

More than **160 original varieties** of petunia, begonia, cyclamen, lily-of-the-valley and other flower varieties have been bred in the company since 1934.
